Package Manager + Virtual Environment

Prof. Marco Mamei

PIP

- Python Package Index (PyPI) è un repository che contiene decine di migliaia di package scritti in Python.
 - GUI, Videogame, Applicazioni Web, Calcolo Scientifico, AI,....
- È possibile accedere ai package del Python Package Index tramite un tool chiamato **pip** (anche integrato in pycharm)
- **pip** è un tool che ci permette di cercare, scaricare ed installare package Python che si trovano sul Python Package Index. pip ci consente inoltre di gestire i package che abbiamo già scaricato, permettendoci di aggiornarli o rimuoverli.

PIP

```
C:\Users\Marco>python

Virtual Environment

- So, why do all of these little details matter?
- By default, every project on your system will use these same directories to store and retrieve site packages (third party libraries). This is not a big problem for system packages (packages that are part of the standard Python library), but it does matter for site packages.
- Consider the following scenario where you have two projects: ProjectA and ProjectB, both of which have a dependency on the same library, ProjectC. The problem becomes apparent when we start requiring different versions of ProjectC. Maybe ProjectA needs v1.0.0, while ProjectB requires the newer v2.0.0.
- This is a real problem for Python since it can't differentiate between versions in the site-packages directory. So both v1.0.0 and v2.0.0 would reside in the same directory with the same name

What Is a Virtual Environment?

- The main purpose of Python virtual environments is to create an isolated environment for Python projects. This means that each project can have its own dependencies, regardless of what dependencies every other project has.

```
C:\Users\Marco>python -m venv project1

C:\Users\Marco>project1\Scripts\activate

(project1) C:\Users\Marco>python
Python 3.7.0 (v3.7.0:1bf9cc5093, Jun 27 2018, 04:06:47) [MSC v.1914 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.

>>> import sys
>>> sys.prefix
'C:\\\\Users\\\\Marco\\\\project1'
>>> import site
>>> site.getsitepackages()
['C:\\\\Users\\\\Marco\\\\project1', 'C:\\\\Users\\\\Marco\\\\project1\\\\lib\\\\site-packages']
```

What Is a Virtual Environment?

```
(project1) C:\Users\Marco>pip install guizero
Collecting guizero
  Using cached https://files.pythonhosted.org/packages/b0/eb/c58693afb94bc1e5f5f77d0f8e6b4e6dc84
Installing collected packages: guizero
Successfully installed guizero-1.1.0
You are using pip version 10.0.1, however version 19.3.1 is available.
You should consider upgrading via the 'python -m pip install --upgrade pip' command.

(project1) C:\Users\Marco>python
Python 3.7.0 (v3.7.0:1bf9cc5093, Jun 27 2018, 04:06:47) [MSC v.1914 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> import guizero
>>> exit()                                     package is visible in project1

(project1) C:\Users\Marco>project1\Scripts\deactivate
C:\Users\Marco>python -m venv project2          exit from project1 - deactivate

C:\Users\Marco>project2\Scripts\activate           create project2

(project2) C:\Users\Marco>python
Python 3.7.0 (v3.7.0:1bf9cc5093, Jun 27 2018, 04:06:47) [MSC v.1914 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.

FONDAMENTI DI PROGRAMMAZIONE**

Git e Github

Prof. Marco Mamei

Git

Git is a popular version control system.

It is used for:

- **Tracking code changes**
- **Tracking who made changes**
- **Coding collaboration**

It allows to

- Manage projects with **Repositories**
- **Clone** a project to work on a local copy
- Control and track changes with **Staging** and **Committing**
- **Branch** and **Merge** to allow for work on different parts and versions of a project
- **Pull** the latest version of the project to a local copy
- **Push** local updates to the main project

Working with Git

- Initialize Git on a folder, making it a **Repository**
- Git now creates a hidden folder to keep track of changes in that folder
- When a file is changed, added or deleted, it is considered **modified**
- You select the modified files you want to **Stage**
- The **Staged** files are **Committed**, which prompts Git to store a **permanent** snapshot of the files
- Git allows you to see the full history of every commit.
- You can revert back to any previous commit.

Git Commands

- Installing Git: <https://git-scm.com/book/en/v2/Getting-Started-Installing-Git>
- Creating Git Folder

```
git --version  
mkdir test  
cd test  
git init
```

- Create new files and check status

```
git status  
  
On branch master  
No commits yet  
  
Untracked files:  
(use "git add <file>..." to include in what will be committed)  
  
    file1.txt  
nothing added to commit but untracked files present (use "git add" to track)
```

- Files in your Git repository can be:
 - **Tracked** - files that Git knows about and are added to the repository
 - **Untracked** - files that are in your working directory, but not added to the repository
- To get Git to track them, you need to **stage** them, or add them to the **staging environment**.

Git Commands

□ Add to staging

```
git add file1.txt  
git add --all  
git add .  
git status --short
```

.gitignore

I can list in this file all the files and directories that I do not want to enter the staging area (e.g., config and password files)

□ Commit

```
git commit -m "First Commit"
```

git status --short

?? - Untracked files
A - Files added to stage
M - Modified files
D - Deleted files

□ Once files change

```
git add .  
git commit -m "Second Commit"  
or  
git commit -a -m "Second Commit"
```

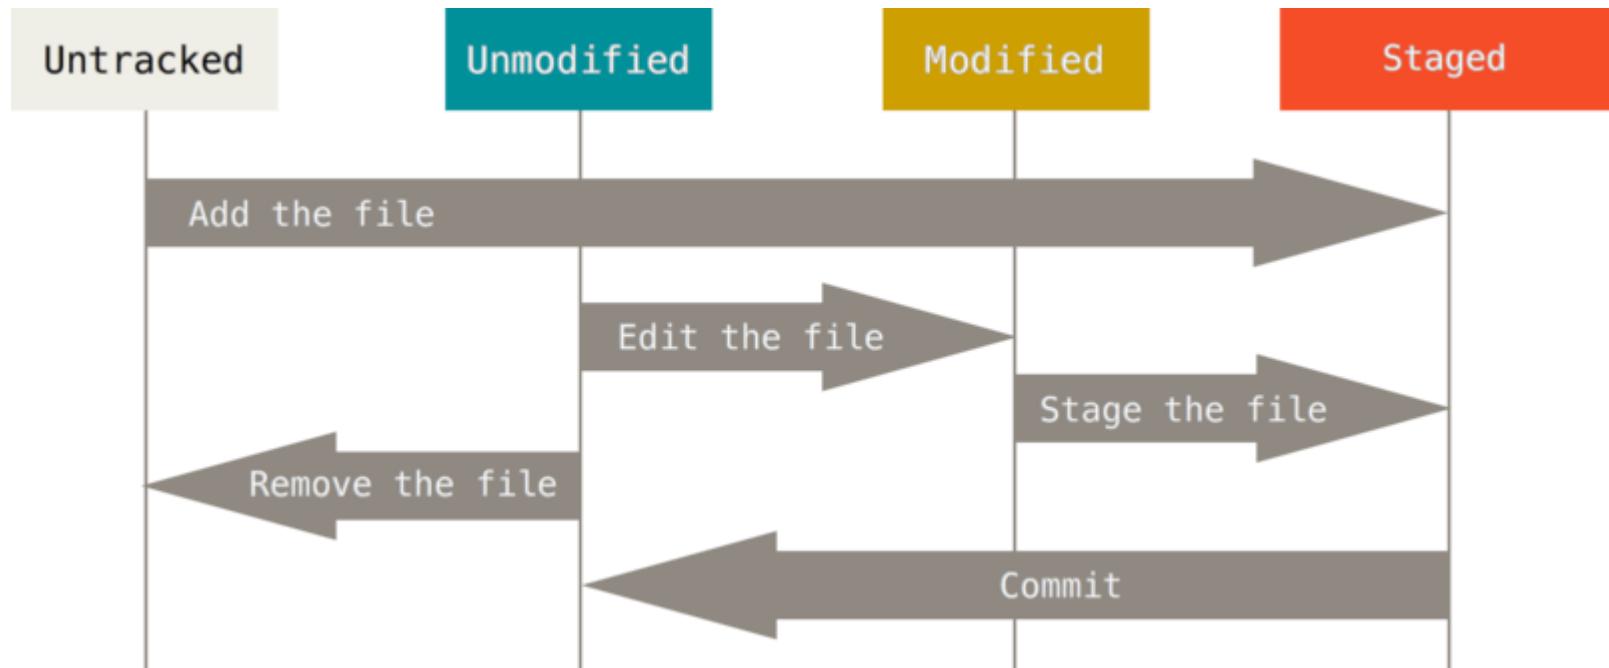

The staging area contains all the changes to be committed. To commit something, you first have to add it to staging

□ See commits' log

```
git log  
git log --oneline
```

Git Commands

- The lifecycle of the status of your files

Git Commands

- Revert (undo) last commit

```
git revert HEAD --no-edit  
git revert HEAD~x --no-edit
```

If you have to revert more than one commit, you have to revert all the commits until that point

- See previous snapshots (without modifying anything)

```
git checkout c0e35b0  
git checkout master
```

Go back to original version (branch)

Git Commands (VSCode)

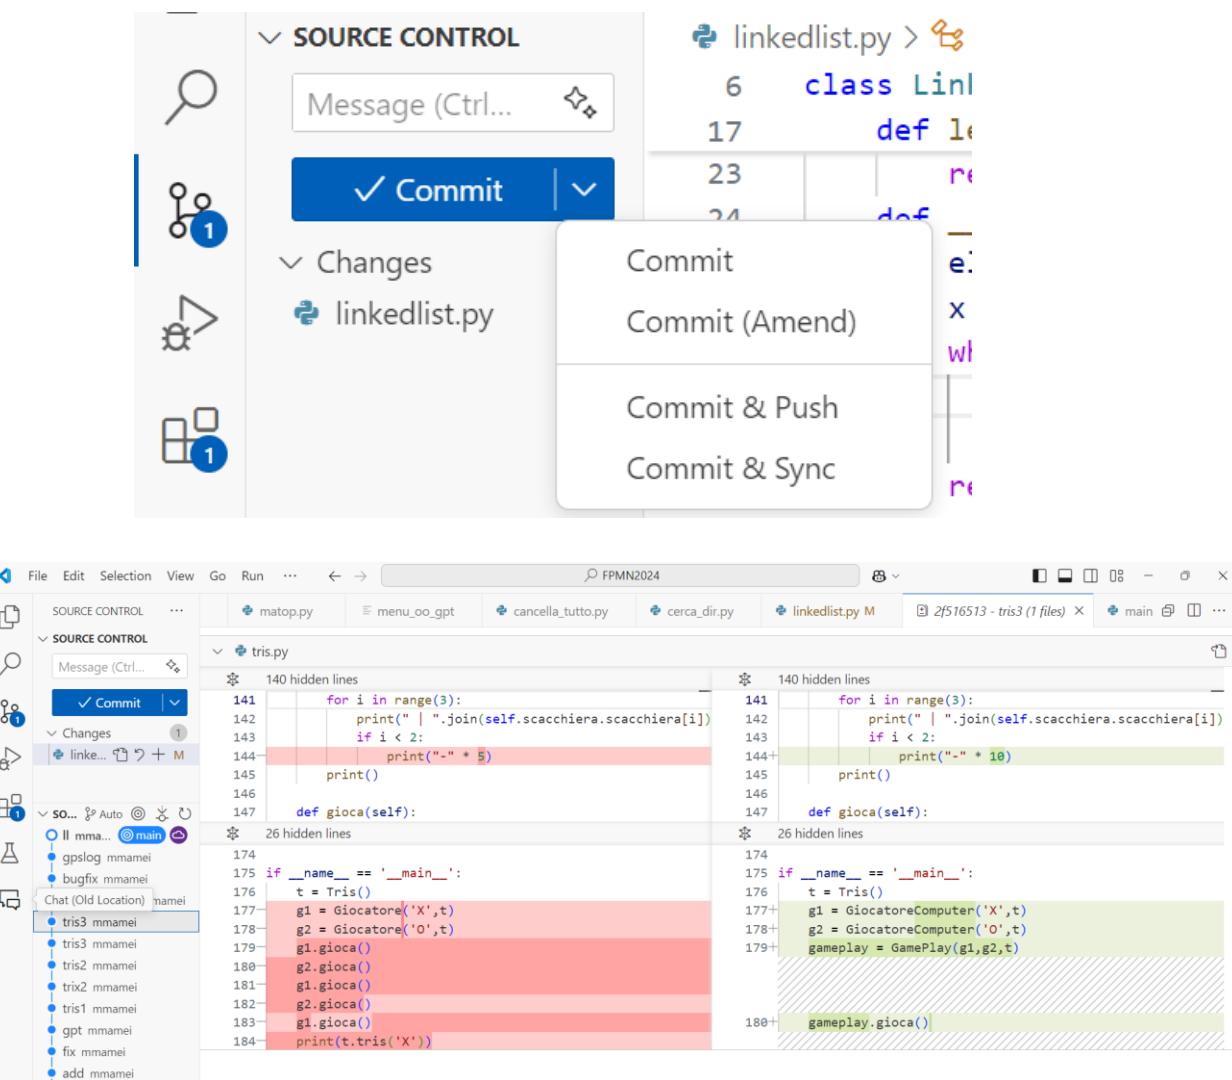

The folder currently open doesn't have a Git repository. You can initialize a repository which will enable source control features powered by Git.

[Initialize Repository](#)

To learn more about how to use Git and source control in VS Code [read our docs](#).

You can directly publish this folder to a GitHub repository. Once published, you'll have access to source control features powered by Git and GitHub.

[Publish to GitHub](#)

GitHub

The image is a composite screenshot of the GitHub website, illustrating the process of creating and managing a new repository.

Top Left: GitHub Homepage

- The header features the GitHub logo and a "Sign up" button.
- The main heading "Where the world builds software" is displayed prominently.
- A sub-copy below states: "Millions of developers and companies build, ship, and maintain their software on GitHub—the largest and most advanced development platform in the world."
- Below the main content are two buttons: "test@w3schools.com" and "Sign up for GitHub".

Middle Left: Create a new repository

- The URL bar shows "test@w3schools.com".
- The top navigation bar includes "Pull requests", "Issues", "Marketplace", and "Explore".
- The main form for creating a new repository:
 - "Owner" dropdown: "w3schools-test".
 - "Repository name" input: "hello-world".
 - "Description (optional)": "Hello World repository for Git tutorial".
 - "Visibility": "Public" (radio button selected).
 - "Initialize this repository with":
 - "Add a README file": "This is where you can write a long description for your project. [Learn more.](#)"
 - "Add .gitignore": "Choose which files not to track from a list of templates. [Learn more.](#)"
 - "Choose a license": "A license tells others what they can and can't do with your code. [Learn more.](#)"
 - "Create repository" button.

Top Right: GitHub Header

- The GitHub logo is in the top left corner.
- The search bar contains "Search or jump to...".
- The top navigation bar includes "Pull requests", "Issues", "Marketplace", and "Explore".
- The user menu icon (three dots) is open, showing a dropdown menu with options: "New repository", "Import repository", "New gist", "New organization", and "New project".

Bottom Right: Repository Details

- The URL bar shows "w3schools-test / hello-world".
- The top navigation bar includes "Unwatch", "Star", "Fork", and "Settings".
- The main content area displays a "Quick setup — if you've done this kind of thing before" section:
 - Buttons for "Set up in Desktop" (with "HTTPS" and "SSH" options), "https://github.com/w3schools-test/hello-world.git", and a download icon.
 - Text: "Get started by [creating a new file](#) or [uploading an existing file](#). We recommend every repository include a README, LICENSE, and .gitignore."

GitHub Commands

□ Push a repository to GitHub

```
git remote add origin https://github.com/mmamei/test.git  
git push --set-upstream origin master
```

git remote -v
origin becomes an alias of
`https://github.com/mmamei/test.git`

□ Clone a repository from GitHub

```
git clone https://github.com/mmamei/test.git  
git clone https://github.com/mmamei/test.git dir
```

Creates the project directory in the
current folder
Or
Into dir folder

□ Push to GitHub

```
git push origin
```

□ Pull from GitHub

```
git pull origin
```
